ABOUT THE ICNS-2023

New vistas in Green Technology and Socio-economic Sustainability

A technology with eco-friendly in its production, supply chain or usage is in fact a sustainable technology or green technology or Green Tech in short. It deals with the short-term and long-term impact of things on the environment. Green technology includes the form of recycling, renewable resources, health and safety issues, energy efficiency, and more. Green technology is therefore an umbrella term that encapsulates any technology to reduce the human influence on the environment. Since humans are using up natural resources faster than they can be replaced, this constantly developing technology seeks to be less stressful on them. It focuses on developing eco-friendly goods and services that enhance operational efficiency while lowering prices, energy usage, trash, or adverse environmental effects. From the last decade, exponential economic growth and industrialization have been witnessed in many countries yet failed to keep the environment sustainable due to various challenges related to resource depletion.

Primary aim of green technology is to safeguard the environment by controlling global warming and reducing the greenhouse effect; protect the natural environment, reduce our dependence on non-renewable natural resources like fossil fuel, and heal the damage done to the environment. The principal concept is to develop innovative inventions that do not affect the natural resources and also preserve the planet's natural resources. It will result in less damage to humans, animals and our planet's overall health. The successful use of green technologies will make a major contribution towards reducing emissions of carbon dioxide and other greenhouse gases. To mitigate environmental risks derived from the industrial revolution, green technologies are expected to become a dominant factor that practically reduces over the CO₂ emission. That is why many developed and some developing countries are now transitioning towards this form of technology to help protect them from harmful impacts on the climate. Green technology is directly and indirectly as well as more or less related with socio-economic sustainability.

The main aim of the present conference is a step forward in this direction to bridge the gap and provide a platform for interaction and deliberations among scientists, researchers, academicians and policy makers from different parts of the globe as green technology has a number of advantages for mankind. Sub themes of ICNS 2023 are as under:
